(57) Abstract :

EMOTIONAL DIRECTING SYSTEM FOR ONLINE LEARNING USING NLP ABSTRACT The rapid growth of online learning platforms has transformed education, offering flexibility and accessibility to learners worldwide. However, one major challenge in virtual learning environments is the lack of face-to-face interaction, which makes it difficult for instructors to perceive and respond to students' emotional states. Emotions play a crucial role in learning outcomes, motivation, and engagement. Therefore, understanding and responding to students' emotions is essential to improve the effectiveness of online education. This project, *Emotion Detection for Online Learning, aims to develop an intelligent system that can automatically recognize and analyze students' emotions during online classes. The system utilizes **facial expression recognition, **speech tone analysis, and **machine learning algorithms* to classify emotions such as happiness, sadness, confusion, boredom, and engagement. It integrates computer vision techniques for facial feature extraction and natural language processing for analyzing speech or text-based responses. The detected emotions are processed in real time and presented to instructors through a dashboard or alert system, enabling them to adapt their teaching methods, provide timely support, and maintain student engagement. The project also incorporates a dataset for training and testing the emotion detection model to ensure accuracy and reliability. By implementing this system, online learning platforms can become more interactive and emotionally aware, leading to improved student satisfaction, motivation, and learning outcomes. This project contributes to the advancement of *intelligent tutoring systems* and *affective computing*, bridging the emotional gap in digital education.
